cURL Practice/Requestbin

We included -i, because it shows the response headers in order to answer the GET request.

```
-i, --include      Include protocol response headers in the output
-G, --get         Put the post data in the URL and use GET
-l, --head        Show document info only
-H, --header <header/@file> Pass custom header(s) to server
-S, --show-error  Show error even when -s is used
-Y, --speed-limit <speed> Stop transfers slower than this
```
